

Sediment Control Comparison

Curlex® vs. Straw

Curled and barbed Curlex fibers are proven to stop sediment

Straight, flat, and smooth straw fibers do very little to slow sediment

Curlex fibers have a higher Manning's N than straw fibers. This "roughness" provides superior sediment control. Curlex fibers expand when they get wet and dig into the soil. This creates a velcro-like connection for superior erosion control. All Curlex erosion and sediment control products are made from sustainably harvested Great Lakes Aspen and are naturally seed free.
