

Soil Filling TriNet® TRMs and Covering with Curlex® II

All TriNet® TRMs from American Excelsior can be installed either over the prepared seed bed or they can be soil filled. If the TRMs are soil filled, a temporary erosion control blanket is used to protect the seed bed. The synergistic approach on this installation used Flexamat®, by Motz Enterprises, down the center of the high flow channel. It was paired with soil filled TriNet Curlex on one side of the channel and soil filled TriNet Recyclex on the other side. Both were then covered with Curlex II. This is a terrific example of using a variety of BMPs to meet the needs of the project.
